ENTERPRISE & PERIMETER SECURITY

Part A: Perimeter Definition & Entry Points

- **Define Physical Perimeter:** Clearly identify the physical boundaries of the site.
- **Boundary Description:** Describe both the visible and invisible boundaries of the location.
- **Identify Parameter Zones:** Classify areas into three specific zones:
    - **Public**
    - **Controlled**
    - **Restricted**
- **Entry Points:** Identify both the primary and secondary entry points on the site.

Part B: Physical and Access Control

- **Control Mechanisms:** Provide the specific control mechanisms you intend to use for the site.
- **Risk Assessment:** Identify the access points that represent the highest security risk.

Part C: Surveillance and Monitoring

- **Infrastructure Description:** Describe the CCTV and monitoring infrastructure to be implemented.
- **Operational Details:** Detail the camera placement, blind spots, and lighting conditions.
- **Classification:** Categorize security measures into three types:
    - **Preventive**
    - **Detective**
    - **Corrective**

Part D: Network and Wireless Perimeter

- **Infrastructure Locations:** Provide the locations where the perimeter infrastructure will be hosted.
- **Wireless Risks:** Identify observed or potential wireless perimeter risks, specifically:
    - Wi-Fi signal spillover
    - Public hotspots
    - Rogue access points

Part E: Human and Operational Factors

- **Human Actors:** Define the various human actors present on the site.
- **Social Engineering:** Describe potential social engineering scenarios that could occur on-site.

Final Deliverables

The project requires the following outputs using tools like **GNS3** or **Cisco Packet Tracer** to model the requirements:

1. **Analysis Report:** A document detailing your findings and the proposed security solutions based on the requirements above.
2. **Implementation Presentation:** A final presentation showcasing the implemented security setup.
